# STAT 510: Homework 10

## David Dalpiaz

Due: Monday, April 26, 11:59 PM

#### Exercise 1 (Normal Means MLE)

Consider  $X_1, \ldots, X_k \sim N(\theta_i, \sigma_i^2)$ . That is, each observation is drawn independently from a normal distribution with potentially different means and variances. Assume the variances are known.

Define  $\theta = (\theta_1, \ldots, \theta_k)$ .

- Find the MLE for  $\theta$ ,  $\hat{\theta}$ .
- Find  $\mathbb{E}\left[\hat{\theta}\right]$
- Find  $\mathbb{V}\begin{bmatrix} \hat{\theta} \\ \hat{\theta} \end{bmatrix}$ . Also note what this result simplifies to when  $\sigma_1 = \ldots = \sigma_k = 1$ .

# Exercise 2 (Estimating a Variance with One Observation)

Consider a single observation,  $X \sim N(0, \sigma^2)$ .

- Find an unbiased estimator of  $\sigma^2$ .
- Find the MLE of  $\sigma$ .

#### Exercise 3 (Inverse Guassian MLE)

Let  $X_1, \ldots, X_n$  be a random sample from the inverse Gaussian distribution

$$f(x;\mu,\lambda) = \left(\frac{\lambda}{2\pi x^3}\right)^{\frac{1}{2}} \exp\left(-\frac{\lambda(x-\mu)^2}{2\mu^2 x}\right), \quad x > 0.$$

Find the MLE of  $\mu$  and  $\lambda$ .

## Exercise 4 (A Regression MLE)

Consider  $Y_1, \ldots, Y_n$  such that

$$Y_i = \beta x_i + \epsilon_i$$

where

- the  $x_i$  are fixed, known constants
- $\epsilon_i \sim N(0, \sigma^2)$
- $\sigma^2$  is unknown.

Find the MLE of  $\beta$  as well as its mean and variance.

#### Exercise 5 (Beta-Geometric Model)

Assume:

- Likelihood:  $X_1, \ldots, X_n \sim \text{Geometric}(p)$
- Prior:  $p \sim \text{Beta}(\alpha, \beta)$

Find the posterior mean of  $p \mid X_1, \ldots, X_n$ , that is, the Bayes estimator of p under squared error loss.

## Exercise 6 (A Simple LRT)

Suppose  $X_1, \ldots, X_n \sim N(\mu, \sigma^2 = 2)$ . Derive the likelihood ratio test for

$$H_0: \mu = 10$$
 versus  $H_1: \mu \neq 10$ .

Use the data stored below in norm data to carry out the test by calculating an approximate p-value using the large sample properties of the likelihood ratio test statistic.

set.seed(42) $norm_data = rnorm(n = 100, mean = 10.4, sd = sqrt(2))$ 

#### Exercise 7 (A LRT for Two Proportions)

Suppose  $X_1, \ldots, X_{n_x} \sim \text{Bernoulli}(p_x)$  and  $Y_1, \ldots, Y_{n_y} \sim \text{Bernoulli}(p_y)$ . Derive the likelihood ratio test for

$$H_0: p_x = p_y$$
 versus  $H_1: p_x \neq p_y$ .

Assuming  $n_x = 20$ ,  $n_y = 30$ , and  $p_x = p_y = 0.3$ , repeatedly simulate from this setup and for each simulation:

- Calculate the likelihood ratio test statistic.
- Calculate the value of the usual "textbook" test statistic where  $\hat{p}$  is the pooled estimate of the proportion.

$$z = \frac{\hat{p}_x - \hat{p}_y}{\sqrt{\hat{p}(1-\hat{p})\left(\frac{1}{n_x} + \frac{1}{n_y}\right)}}$$

Using the results of these simulations:

- Plot a histogram of the calculated likelihood ratio test statistics and overlay the approximate distribution of the test statistic under the null hypothesis.
- Create a scatter plot of the likelihood ratio versus the textbook test statistics. What do you notice?

#### Exercise 8 (An ANOVA Adjacent LRT)

Suppose

 $\begin{array}{l} \bullet \quad X_1, \dots, X_{n_x} \sim N(\mu_x, \sigma_x^2). \\ \bullet \quad Y_1, \dots, Y_{n_y} \sim N(\mu_y, \sigma_y^2). \\ \bullet \quad Z_1, \dots, Z_{n_z} \sim N(\mu_z, \sigma_z^2). \end{array}$ 

Derive the likelihood ratio test for  $H_0: \sigma_x^2 = \sigma_y^2 = \sigma_z^2$  versus an alternative that allows for at least one unequal variance.

Use the data stored below in the vectors  $\mathbf{x}$ ,  $\mathbf{y}$ , and  $\mathbf{z}$  to carry out the test by calculating an approximate p-value using the large sample properties of the likelihood ratio test statistic. (Note that this data is **not** tidy, but is instead stored in a format that is easy to understand.) Does the result match your expectation?

```
set.seed(42)
x = rnorm(n = 50, mean = -5, sd = 1)
y = rnorm(n = 60, mean = 0, sd = 1)
z = rnorm(n = 70, mean = 5, sd = 1)
```
